

CS 1428
Lab 1 Sections 19 and 06

Jared Wallace

Review Topics

- c++ program layout
- literals and variables
- common errors
- debugging

Part 1: Debugging

Inside today's zip archive you should find two files named **lab1_0.cpp** and **lab1_1.cpp**. Download this archive, unzip it and place each file into a new Eclipse project (thats two separate projects!). If you try to run them you will see that they fail. Your job is to find the common mistakes in these programs, correct them, and get the programs to run.

Part 2: Make your own program

I would like you to make your own program. This program will need to output a couple of things:

- at least 1 string literal
- at least 1 new line
- at least one integer variable
- at least one double variable

All context is up to you, just be sure to have all of the requirements and meet all style standards.
